Outline

- A simple example of a conservation law
- The Korteweg-de Vries equation
- The Zakharov-Kuznetsov equation
- Methods for computing conservation laws
- Tools (variational calculus, differential geometry)
 - The variational derivative (testing exactness)
 - The homotopy operator (inverting D_x and Div)
- Application 1: The KdV equation
- Application 2: The Zakharov-Kuznetsov equation
- Demonstration of *ConservationLawsMD.m*
- Conclusions and future work

- Additional examples
 - ▶ Manakov-Santini system
 - ▶ Camassa-Holm equation in (2+1) dimensions
 - ▶ Khoklov-Zabolotskaya equation
 - ▶ Shallow water wave model for atmosphere
 - ▶ Kadomtsev-Petviashvili equation
 - ▶ Potential Kadomtsev-Petviashvili equation
 - ▶ Generalized Zakharov-Kuznetsov equation

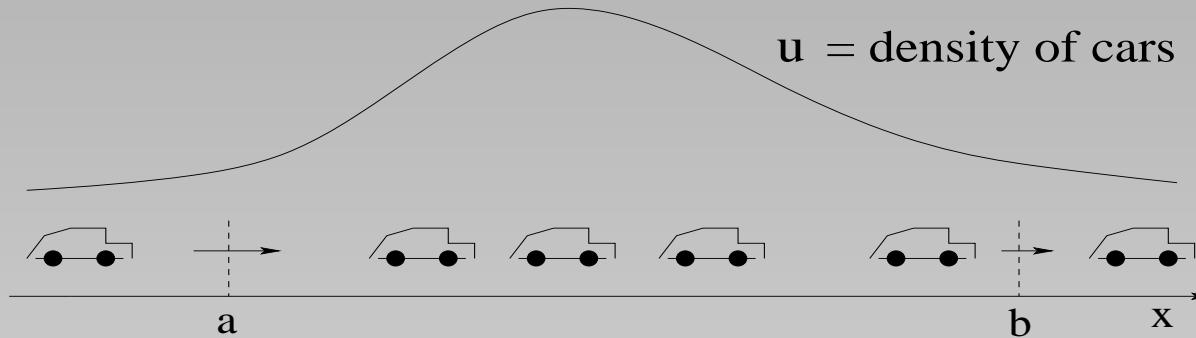

Example of a Conservation Law in Traffic Flow

Modeling the density of cars (Bressan, 2009)

$u(x, t)$ density of cars on a highway (e.g., number of cars per km).

$s(u)$ mean (equilibrium) speed (e.g., in km per hour) of the cars. It depends on the density.

Change in number of cars in segment $[a, b]$ equals the difference between cars entering at a and leaving at b during time interval $[t_1, t_2]$:

$$\int_a^b (u(x, t_2) - u(x, t_1)) \, dx = \int_{t_1}^{t_2} (J(a, t) - J(b, t)) \, dt$$

$$\int_a^b \left(\int_{t_1}^{t_2} u_t(x, t) \, dt \right) \, dx = - \int_{t_1}^{t_2} \left(\int_a^b J_x(x, t) \, dx \right) \, dt$$

where $J(x, t) = u(x, t)s(u(x, t))$ is the traffic flow (e.g., in cars per hour) at location x and time t .

Then, $\int_a^b \int_{t_1}^{t_2} (u_t + J_x) dt dx = 0$ holds $\forall(a, b, t_1, t_2)$.

This yields the conservation law:

$$u_t + [s(u) u]_x = 0 \quad \text{or} \quad D_t \rho + D_x J = 0$$

$\rho = u$ is the conserved density;

$J(u) = s(u) u$ is the associated flux.

A simple Lighthill-Whitham-Richards model:

$$s(u) = s_{\max} \left(1 - \frac{u}{u_{\max}} \right), \quad 0 \leq u \leq u_{\max}$$

s_{\max} is posted road speed, u_{\max} is the jam density.

Conservation Laws for Nonlinear PDEs

- System of evolution equations of order M

$$\mathbf{u}_t = \mathbf{F}(\mathbf{u}^{(M)}(\mathbf{x}))$$

with $\mathbf{u} = (u, v, w, \dots)$ and $\mathbf{x} = (x, y, z)$.

- Conservation law in (1+1)-dimensions

$$\mathbf{D}_t \rho + \mathbf{D}_x J \doteq 0$$

where the dot means evaluated on the PDE.

Conserved density ρ and flux J .

$$P = \int_{-\infty}^{\infty} \rho dx = \text{constant in time}$$

if J vanishes at $\pm\infty$.

- Conservation law in (2+1)-dimensions

$$D_t \rho + \nabla \cdot \mathbf{J} = D_t \rho + D_x J_1 + D_y J_2 \doteq 0$$

Conserved density ρ and flux $\mathbf{J} = (J_1, J_2)$.

- Conservation law in (3+1)-dimensions

$$D_t \rho + \nabla \cdot \mathbf{J} = D_t \rho + D_x J_1 + D_y J_2 + D_z J_3 \doteq 0$$

Conserved density ρ and flux $\mathbf{J} = (J_1, J_2, J_3)$.

- Computing total derivatives: D_t, D_x, D_y, \dots

Example: If $f = t^2 u^3 u_x^2$ then

$$\begin{aligned}
 D_t f &= \frac{\partial f}{\partial t} + \frac{\partial f}{\partial u} \frac{\partial u}{\partial t} + \frac{\partial f}{\partial u_x} \frac{\partial u_x}{\partial t} \\
 &= \frac{\partial f}{\partial t} + u_t \frac{\partial f}{\partial u} + u_{xt} \frac{\partial f}{\partial u_x} \\
 &= 2tu^3u_x^2 + 3t^2u^2u_tu_x^2 + 2t^2u^3u_xu_{xt}
 \end{aligned}$$

Reasons for Computing Conservation Laws

- Conservation of physical quantities (linear momentum, mass, energy, electric charge, ...).
- Testing of complete integrability and application of Inverse Scattering Transform.
- Testing of numerical integrators.
- Study of quantitative and qualitative properties of PDEs (Hamiltonian structure, recursion operators, . . .).
- Verify the closure of a model.

Examples of PDEs with Conservation Laws

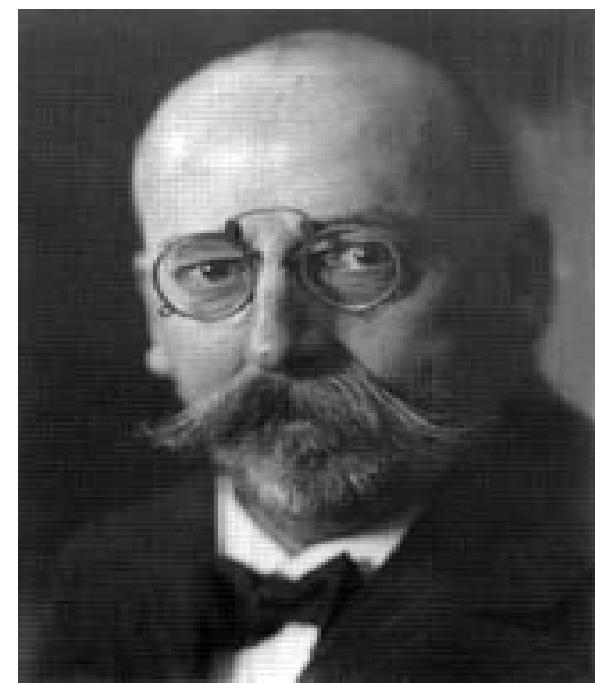

Example 1: KdV Equation

$$\frac{\partial u}{\partial t} + 6u \frac{\partial u}{\partial x} + \frac{\partial^3 u}{\partial x^3} = 0 \quad \text{or} \quad u_t + 6uu_x + u_{xxx} = 0$$

shallow water waves, ion-acoustic waves in plasmas

Diederik Korteweg

Gustav de Vries

Dilation Symmetry

$$u_t + 6uu_x + u_{xxx} = 0$$

has dilation (scaling) symmetry $(x, t, u) \rightarrow (\frac{x}{\kappa}, \frac{t}{\kappa^3}, \kappa^2 u)$
 κ is an arbitrary parameter.

Notion of **weight**: $W(x) = -1$, thus, $W(D_x) = 1$.

$W(t) = -3$, hence, $W(D_t) = 3$.

$W(u) = 2$.

Notion of **rank** (total weight of a monomial).

Examples: $\text{Rank}(u^3) = \text{Rank}(3u_x^2) = 6$.

$\text{Rank}(u^3u_{xx}) = 10$.

Key Observation: Homogeneity under Scaling

Every term in a density has the same fixed rank.

Every term in a flux has some other fixed rank.

The conservation law

$$D_t \rho + D_x J \doteq 0$$

is uniform in rank.

Hence,

$$\text{Rank}(\rho) + \text{Rank}(D_t) = \text{Rank}(J) + \text{Rank}(D_x)$$

- First six (of infinitely many) conservation laws:

$$D_t(u) + D_x(3u^2 + u_{xx}) \doteq 0$$

$$D_t(u^2) + D_x(4u^3 - u_x^2 + 2uu_{xx}) \doteq 0$$

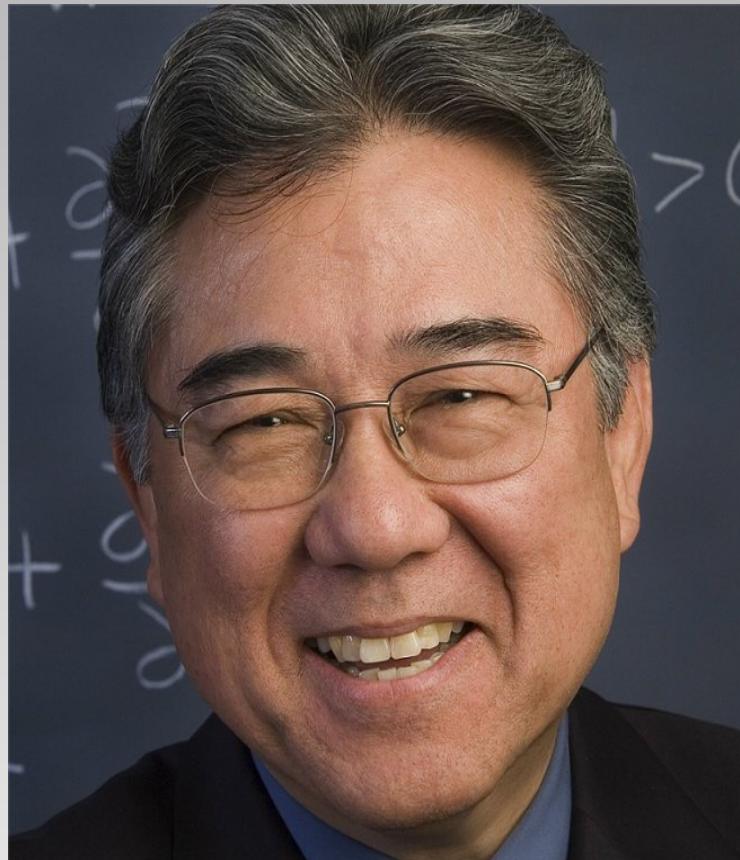

$$D_t\left(u^3 - \frac{1}{2}u_x^2\right)$$

$$+ D_x\left(\frac{9}{2}u^4 - 6uu_x^2 + 3u^2u_{xx} + \frac{1}{2}u_{xx}^2 - u_xu_{xxx}\right) \doteq 0$$

$$D_t\left(u^4 - 2uu_x^2 + \frac{1}{5}u_{xx}^2\right) + D_x\left(\frac{24}{5}u^5 - 18uu_x^2 + 4u^3u_{xx} + 2u_x^2u_{xx} + \frac{16}{5}uu_{xx}^2 - 4uu_xu_{xxx} - \frac{1}{5}u_{xxx}^2 + \frac{2}{5}u_{xx}u_{4x}\right) \doteq 0$$

$$\begin{aligned}
& D_t \left(u^5 - 5u^2 u_x^2 + uu_{xx}^2 - \frac{1}{14} u_{xxx}^2 \right) \\
& + D_x \left(5u^6 - 40u^3 u_x^2 - \dots - \frac{1}{7} u_{xxx} u_{5x} \right) \doteq 0 \\
& D_t \left(u^6 - 10u^3 u_x^2 - \frac{5}{6} u_x^4 + 3u^2 u_{xx}^2 \right. \\
& \quad \left. + \frac{10}{21} u_{xx}^3 - \frac{3}{7} uu_{xxx}^2 + \frac{1}{42} u_{4x}^2 \right) \\
& + D_x \left(\frac{36}{7} u^7 - 75u^4 u_x^2 - \dots + \frac{1}{21} u_{4x} u_{6x} \right) \doteq 0
\end{aligned}$$

- Third conservation law: Gerald Whitham, 1965
- Fourth and fifth: Norman Zabusky, 1965-66
- Seventh (sixth thru tenth): Robert Miura, 1966

Robert Miura

- Conservation law explicitly dependent on t and x :

$$D_t \left(t u^2 - \frac{1}{3} x u \right)$$

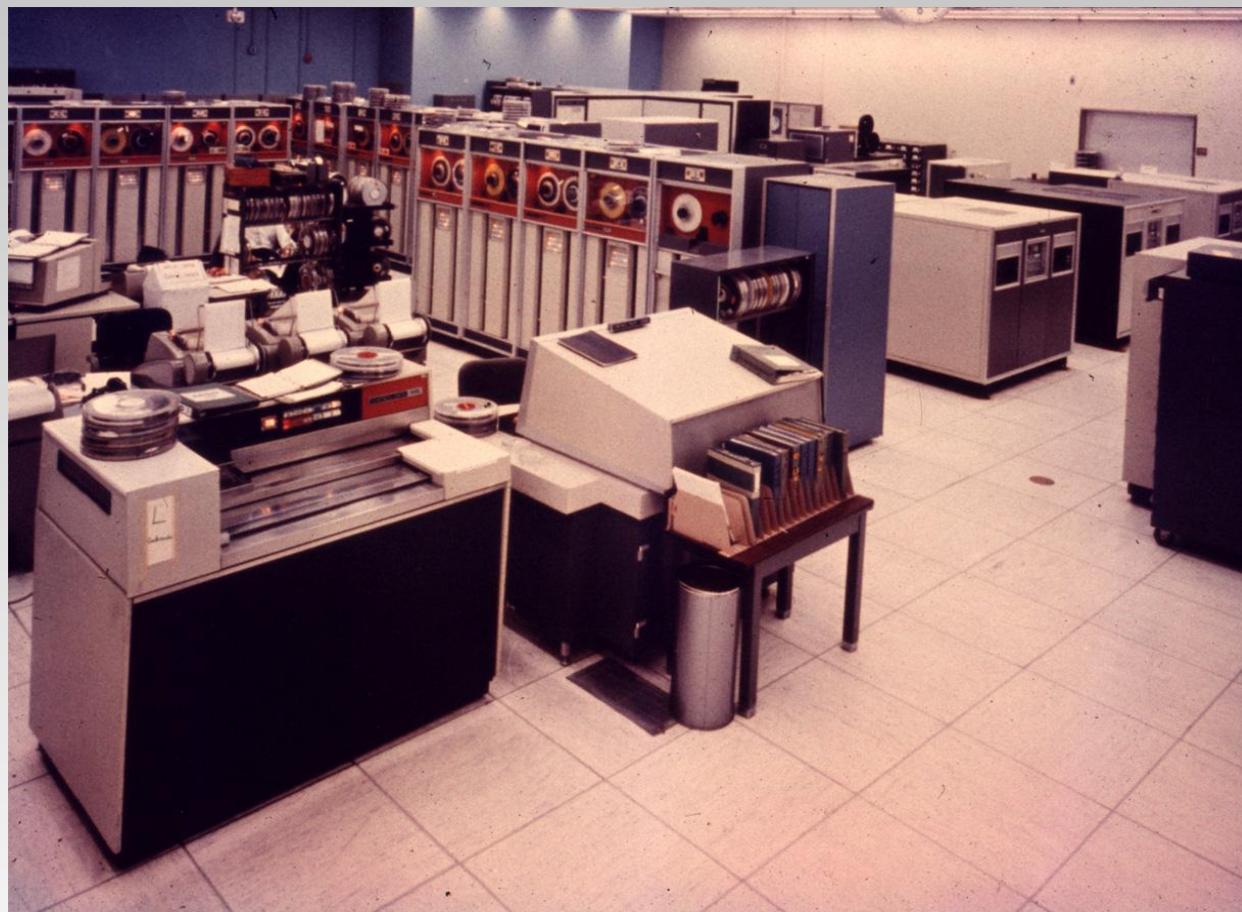

$$+ D_x \left(4 t u^3 - x u^2 + \frac{1}{3} u_x - t u_x^2 + 2 t u u_{xx} - \frac{1}{3} x u_{xx} \right) \doteq 0$$

- First five: IBM 7094 computer with FORMAC (1966) → storage space problem!

IBM 7094 Computer

- First eleven densities: Control Data Computer
CDC-6600 computer (2.2 seconds)
→ large integers problem!

Control Data CDC-6600

Example 2: The Zakharov-Kuznetsov Equation

$$u_t + \alpha u u_x + \beta(u_{xx} + u_{yy})_x = 0$$

models ion-sound solitons in a low pressure uniform magnetized plasma.

- Conservation laws:

$$D_t(u) + D_x\left(\frac{\alpha}{2}u^2 + \beta u_{xx}\right) + D_y(\beta u_{xy}) = 0$$

$$\begin{aligned} D_t(u^2) + D_x\left(\frac{2\alpha}{3}u^3 - \beta(u_x^2 - u_y^2) + 2\beta u(u_{xx} + u_{yy})\right) \\ + D_y(-2\beta u_x u_y) = 0 \end{aligned}$$

- More conservation laws (ZK equation):

$$\begin{aligned} & D_t \left(u^3 - \frac{3\beta}{\alpha} (u_x^2 + u_y^2) \right) + D_x \left(3u^2 \left(\frac{\alpha}{4} u^2 + \beta u_{xx} \right) - 6\beta u (u_x^2 + u_y^2) \right. \\ & \quad \left. + \frac{3\beta^2}{\alpha} (u_{xx}^2 - u_{yy}^2) - \frac{6\beta^2}{\alpha} (u_x (u_{xxx} + u_{xyy}) + u_y (u_{xxy} + u_{yyy})) \right) \\ & + D_y \left(3\beta u^2 u_{xy} + \frac{6\beta^2}{\alpha} u_{xy} (u_{xx} + u_{yy}) \right) = 0 \end{aligned}$$

$$\begin{aligned} & D_t \left(t u^2 - \frac{2}{\alpha} x u \right) + D_x \left(t \left(\frac{2\alpha}{3} u^3 - \beta (u_x^2 - u_y^2) + 2\beta u (u_{xx} + u_{yy}) \right) \right. \\ & \quad \left. - x \left(u^2 + \frac{2\beta}{\alpha} u_{xx} \right) + \frac{2\beta}{\alpha} u_x \right) + D_y \left(- 2\beta (t u_x u_y + \frac{1}{\alpha} x u_{xy}) \right) = 0 \end{aligned}$$

Methods for Computing Conservation Laws

- Use the Lax pair L and A , satisfying $[L, A] = 0$.
If $L = D_x + U$, $A = D_t + V$ then $V_x - U_t + [U, V] = 0$.
 $\hat{L} = TLT^{-1}$ gives the densities, $\hat{A} = TAT^{-1}$ gives the fluxes.
- Use Noether's theorem (Lagrangian formulation) to generate conservation laws from symmetries (Ovsiannikov, Olver, Mahomed, Kara, etc.).
- Integrating factor methods (Anderson, Bluman, Anco, Cheviakov, Mason, Naz, etc.) require solving ODEs (or PDEs).

Proposed Algorithmic Method

- Density is linear combination of scaling homogeneous terms (in the jet space) with undetermined coefficients.
- Compute $D_t \rho$ with total derivative operator.
- Use variational derivative (Euler operator) to express exactness.
- Solve a (parametrized) linear system to find the undetermined coefficients.
- Use the homotopy operator to compute the flux (invert D_x or Div).

- Work with linearly independent pieces in finite dimensional spaces.
- Use linear algebra, calculus, and variational calculus (algorithmic).
- Implement the algorithm in Mathematica.

Tools from the Calculus of Variations

Differential Topology and Differential Geometry

- Definition:

A differential function f is a **exact** iff $f = \text{Div } \mathbf{F}$.

Special case (1D): $f = D_x F$.

- Question: How can one test that $f = \text{Div } \mathbf{F}$?
- Theorem (exactness test):

$f = \text{Div } \mathbf{F}$ iff $\mathcal{L}_{u^{(j)}(\mathbf{x})} f \equiv 0$, $j = 1, 2, \dots, N$.

N is the number of dependent variables.

The Euler operator annihilates divergences

- Euler operator in 1D (variable $u(x)$):

$$\begin{aligned}\mathcal{L}_{u(x)} &= \sum_{k=0}^M (-\text{D}_x)^k \frac{\partial}{\partial u_{kx}} \\ &= \frac{\partial}{\partial u} - \text{D}_x \frac{\partial}{\partial u_x} + \text{D}_x^2 \frac{\partial}{\partial u_{xx}} - \text{D}_x^3 \frac{\partial}{\partial u_{xxx}} + \dots\end{aligned}$$

- Euler operator in 2D (variable $u(x, y)$):

$$\begin{aligned}\mathcal{L}_{u(x,y)} &= \sum_{k=0}^{M_x} \sum_{\ell=0}^{M_y} (-\text{D}_x)^k (-\text{D}_y)^\ell \frac{\partial}{\partial u_{kx \ell y}} \\ &= \frac{\partial}{\partial u} - \text{D}_x \frac{\partial}{\partial u_x} - \text{D}_y \frac{\partial}{\partial u_y} \\ &\quad + \text{D}_x^2 \frac{\partial}{\partial u_{xx}} + \text{D}_x \text{D}_y \frac{\partial}{\partial u_{xy}} + \text{D}_y^2 \frac{\partial}{\partial u_{yy}} - \text{D}_x^3 \frac{\partial}{\partial u_{xxx}} \dots\end{aligned}$$

Application: Testing Exactness

Example:

$$f = 8v_x v_{xx} - u_x^3 \sin u + 2u_x u_{xx} \cos u - 6vv_x \cos u + 3u_x v^2 \sin u$$

where $u(x)$ and $v(x)$

- f is exact
- After integration by parts (by hand):

$$F = \int f dx = 4v_x^2 + u_x^2 \cos u - 3v^2 \cos u$$

- Exactness test with Euler operator:

$$f = 8v_x v_{xx} - u_x^3 \sin u + 2u_x u_{xx} \cos u - 6vv_x \cos u + 3u_x v^2 \sin u$$

$$\mathcal{L}_{u(x)} f = \frac{\partial f}{\partial u} - D_x \frac{\partial f}{\partial u_x} + D_x^2 \frac{\partial f}{\partial u_{xx}} \equiv 0$$

$$\mathcal{L}_{v(x)} f = \frac{\partial f}{\partial v} - D_x \frac{\partial f}{\partial v_x} + D_x^2 \frac{\partial f}{\partial v_{xx}} \equiv 0$$

- Question: How can one compute $\mathbf{F} = \text{Div}^{-1} f$?
- Theorem (integration by parts):
 - In 1D: If f is exact then

$$F = D_x^{-1}f = \int f dx = \mathcal{H}_{\mathbf{u}(x)}f$$

- In 2D: If f is a divergence then

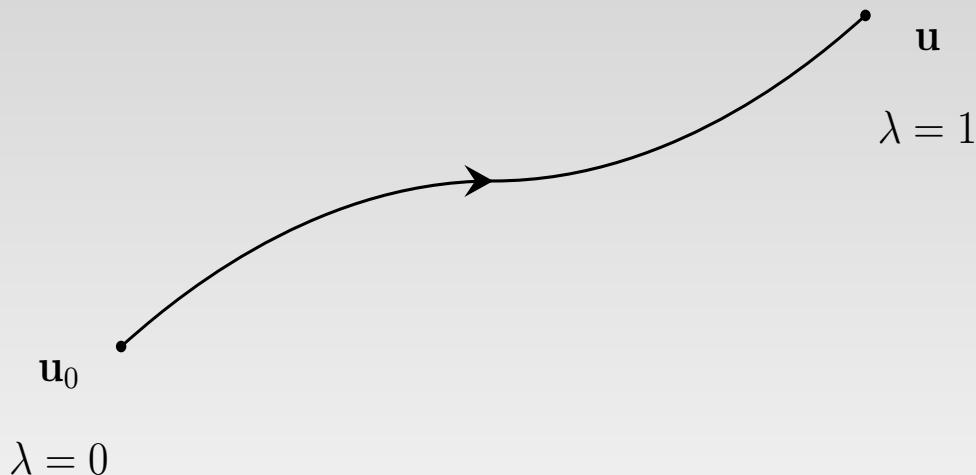

$$\mathbf{F} = \text{Div}^{-1} f = (\mathcal{H}_{\mathbf{u}(x,y)}^{(x)}f, \mathcal{H}_{\mathbf{u}(x,y)}^{(y)}f)$$

The homotopy operator inverts total derivatives and divergences!

Concept from (differential) Topology

Homotopic & Homotopy

Two continuous functions are called **homotopic** if one can be “continuously deformed” into the other. Such a deformation is called a **homotopy** between the two functions.

$$T(u_0, u) = u_0 + \lambda(u - u_0) = (1 - \lambda)u_0 + \lambda u$$

If $u_0 = 0$ then simply replace u by λu since $T(0, u) = \lambda u$.

- Homotopy Operator in 1D (variable x):

$$\mathcal{H}_{\mathbf{u}(x)} f = \int_0^1 \sum_{j=1}^N (I_{u^{(j)}} f)[\lambda \mathbf{u}] \frac{d\lambda}{\lambda}$$

with integrand

$$I_{u^{(j)}} f = \sum_{k=1}^{M_x^{(j)}} \left(\sum_{i=0}^{k-1} u_{ix}^{(j)} (-\mathcal{D}_x)^{k-(i+1)} \right) \frac{\partial f}{\partial u_{kx}^{(j)}}$$

$(I_{u^{(j)}} f)[\lambda \mathbf{u}]$ means that in $I_{u^{(j)}} f$ one replaces
 $\mathbf{u} \rightarrow \lambda \mathbf{u}, \mathbf{u}_x \rightarrow \lambda \mathbf{u}_x, \text{ etc.}$

More general: $\mathbf{u} \rightarrow \lambda(\mathbf{u} - \mathbf{u}_0) + \mathbf{u}_0$

$\mathbf{u}_x \rightarrow \lambda(\mathbf{u}_x - \mathbf{u}_{x0}) + \mathbf{u}_{x0}$ etc.

- Homotopy Operator in 2D (variables x and y):

$$\mathcal{H}_{\mathbf{u}(x,y)}^{(x)} f = \int_0^1 \sum_{j=1}^N (I_{u^{(j)}}^{(x)} f)[\lambda \mathbf{u}] \frac{d\lambda}{\lambda}$$

$$\mathcal{H}_{\mathbf{u}(x,y)}^{(y)} f = \int_0^1 \sum_{j=1}^N (I_{u^{(j)}}^{(y)} f)[\lambda \mathbf{u}] \frac{d\lambda}{\lambda}$$

where for dependent variable $u(x, y)$

$$\begin{aligned} \mathcal{I}_u^{(x)} f &= \sum_{k=1}^{M_x} \sum_{\ell=0}^{M_y} \left(\sum_{i=0}^{k-1} \sum_{j=0}^{\ell} u_{ix} j_y \frac{\binom{i+j}{i} \binom{k+\ell-i-j-1}{k-i-1}}{\binom{k+\ell}{k}} \right. \\ &\quad \left. (-D_x)^{k-i-1} (-D_y)^{\ell-j} \right) \frac{\partial f}{\partial u_{kx \ell y}} \end{aligned}$$

Application 1: The KdV Equation

$$u_t + 6uu_x + u_{xxx} = 0$$

- Step 1: Compute the dilation symmetry

Set $(x, t, u) \rightarrow (\frac{x}{\kappa}, \frac{t}{\kappa^a}, \kappa^b u) = (\tilde{x}, \tilde{t}, \tilde{u})$

Apply change of variables (chain rule)

$$\kappa^{-(a+b)} \tilde{u}_{\tilde{t}} + \kappa^{-(2b+1)} \tilde{u} \tilde{u}_{\tilde{x}} + \kappa^{-(b+3)} \tilde{u}_{3\tilde{x}} = 0$$

Solve $a + b = 2b + 1 = b + 3$.

Solution: $a = 3$ and $b = 2$

$$(x, t, u) \rightarrow \left(\frac{x}{\kappa}, \frac{t}{\kappa^3}, \kappa^2 u\right)$$

Compute the density of selected **rank**, say, 6.

- **Step 2: Determine the form of the density**

List powers of u , up to rank 6 : $[u, u^2, u^3]$

Differentiate with respect to x to increase the rank

u has weight 2 → apply D_x^4

u^2 has weight 4 → apply D_x^2

u^3 has weight 6 → no derivatives needed

Apply the D_x derivatives

Remove total and highest derivative terms:

$$D_x^4 u \rightarrow \{u_{4x}\} \rightarrow \text{empty list}$$

$$D_x^2 u^2 \rightarrow \{u_x^2, uu_{xx}\} \rightarrow \{u_x^2\}$$

$$\text{since } uu_{xx} = (uu_x)_x - u_x^2$$

$$D_x^0 u^3 \rightarrow \{u^3\} \rightarrow \{u^3\}$$

Linearly combine the “building blocks”

Candidate density: $\boxed{\rho = c_1 u^3 + c_2 u_x^2}$

- **Step 3: Compute the coefficients c_i** Compute

$$\begin{aligned}
 D_t \rho &= \frac{\partial \rho}{\partial t} + \rho'(u)[u_t] \\
 &= \frac{\partial \rho}{\partial t} + \sum_{k=0}^M \frac{\partial \rho}{\partial u_{kx}} D_x^k u_t \\
 &= (3c_1 u^2 I + 2c_2 u_x D_x) u_t
 \end{aligned}$$

Substitute u_t by $-(6uu_x + u_{xxx})$

$$\begin{aligned}
 E &= -D_t \rho = (3c_1 u^2 I + 2c_2 u_x D_x)(6uu_x + u_{xxx}) \\
 &= 18c_1 u^3 u_x + 12c_2 u_x^3 + 12c_2 u u_x u_{xx} \\
 &\quad + 3c_1 u^2 u_{xxx} + 2c_2 u_x u_{4x}
 \end{aligned}$$

Apply the Euler operator (variational derivative)

$$\mathcal{L}_u(x) = \frac{\delta}{\delta u} = \sum_{k=0}^m (-D_x)^k \frac{\partial}{\partial u_{kx}}$$

Here, E has order $m = 4$, thus

$$\begin{aligned}\mathcal{L}_u(x) E &= \frac{\partial E}{\partial u} - D_x \frac{\partial E}{\partial u_x} + D_x^2 \frac{\partial E}{\partial u_{xx}} - D_x^3 \frac{\partial E}{\partial u_{3x}} + D_x^4 \frac{\partial E}{\partial u_{4x}} \\ &= -18(c_1 + 2c_2)u_x u_{xx}\end{aligned}$$

This term must vanish!

So, $c_2 = -\frac{1}{2}c_1$. Set $c_1 = 1$ then $c_2 = -\frac{1}{2}$.

Hence, the final form density is $\boxed{\rho = u^3 - \frac{1}{2}u_x^2}$

- **Step 4: Compute the flux J**

Method 1: Integrate by parts (simple cases)

Now,

$$E = 18u^3u_x + 3u^2u_{xxx} - 6u_x^3 - 6uu_xu_{xx} - u_xu_{xxxx}$$

Integration of $D_x J = E$ yields the **flux**

$$J = \frac{9}{2}u^4 - 6uu_x^2 + 3u^2u_{xx} + \frac{1}{2}u_{xx}^2 - u_xu_{xxx}$$

Method 2: Use the homotopy operator

$$J = D_x^{-1} E = \int E dx = \mathcal{H}_{\mathbf{u}(x)} E = \int_0^1 (I_u E)[\lambda \mathbf{u}] \frac{d\lambda}{\lambda}$$

with integrand

$$I_u E = \sum_{k=1}^M \left(\sum_{i=0}^{k-1} u_{ix} (-D_x)^{k-(i+1)} \right) \frac{\partial E}{\partial u_{kx}}$$

Here $M = 4$, thus

$$\begin{aligned}
 I_u E &= (u\mathbf{I})\left(\frac{\partial E}{\partial u_x}\right) + (u_x\mathbf{I} - u\mathbf{D}_x)\left(\frac{\partial E}{\partial u_{xx}}\right) \\
 &\quad + (u_{xx}\mathbf{I} - u_x\mathbf{D}_x + u\mathbf{D}_x^2)\left(\frac{\partial E}{\partial u_{xxx}}\right) \\
 &\quad + (u_{xxx}\mathbf{I} - u_{xx}\mathbf{D}_x + u_x\mathbf{D}_x^2 - u\mathbf{D}_x^3)\left(\frac{\partial E}{\partial u_{4x}}\right) \\
 &= (u\mathbf{I})(18u^3 + 18u_x^2 - 6uu_{xx} - u_{xxxx}) \\
 &\quad + (u_x\mathbf{I} - u\mathbf{D}_x)(-6uu_x) \\
 &\quad + (u_{xx}\mathbf{I} - u_x\mathbf{D}_x + u\mathbf{D}_x^2)(3u^2) \\
 &\quad + (u_{xxx}\mathbf{I} - u_{xx}\mathbf{D}_x + u_x\mathbf{D}_x^2 - u\mathbf{D}_x^3)(-u_x) \\
 &= 18u^4 - 18uu_x^2 + 9u^2u_{xx} + u_{xx}^2 - 2u_xu_{xxx}
 \end{aligned}$$

Note: correct terms but incorrect coefficients!

Finally,

$$\begin{aligned} J &= \mathcal{H}_{u(x)} E = \int_0^1 (I_u E)[\lambda u] \frac{d\lambda}{\lambda} \\ &= \int_0^1 \left(18\lambda^3 u^4 - 18\lambda^2 u u_x^2 + 9\lambda^2 u^2 u_{xx} + \lambda u_{xx}^2 \right. \\ &\quad \left. - 2\lambda u_x u_{xxx} \right) d\lambda \\ &= \frac{9}{2} u^4 - 6u u_x^2 + 3u^2 u_{xx} + \frac{1}{2} u_{xx}^2 - u_x u_{xxx} \end{aligned}$$

Final form of the flux:

$$J = \frac{9}{2} u^4 - 6u u_x^2 + 3u^2 u_{xx} + \frac{1}{2} u_{xx}^2 - u_x u_{xxx}$$

Application 2: Zakharov-Kuznetsov Equation

$$u_t + \alpha u u_x + \beta(u_{xx} + u_{yy})_x = 0$$

- Step 1: Compute the dilation invariance
ZK equation is scaling homogeneous under scaling symmetry

$$(t, x, y, u) \rightarrow \left(\frac{t}{\kappa^3}, \frac{x}{\kappa}, \frac{y}{\kappa}, \kappa^2 u \right) = (\tilde{t}, \tilde{x}, \tilde{y}, \tilde{u})$$

κ is an arbitrary parameter.

- Hence, the weights of the variables are

$$W(u) = 2, \quad W(D_t) = 3, \quad W(D_x) = 1, \quad W(D_y) = 1.$$

- A conservation law is scaling homogeneous under the scaling symmetry of the PDE.

$$W(u) = 2, \quad W(D_t) = 3, \quad W(D_x) = 1, \quad W(D_y) = 1.$$

For example,

$$\begin{aligned} & D_t \left(u^3 - \frac{3\beta}{\alpha} (u_x^2 + u_y^2) \right) + D_x \left(3u^2 \left(\frac{\alpha}{4} u^2 + \beta u_{xx} \right) - 6\beta u (u_x^2 + u_y^2) \right. \\ & \left. + \frac{3\beta^2}{\alpha} (u_{xx}^2 - u_{xy}^2) - \frac{6\beta^2}{\alpha} (u_x (u_{xxx} + u_{xyy}) + u_y (u_{xxy} + u_{yyy})) \right) \\ & + D_y \left(3\beta u^2 u_{xy} + \frac{6\beta^2}{\alpha} u_{xy} (u_{xx} + u_{yy}) \right) = 0 \end{aligned}$$

$$\text{Rank } (\rho) = 6, \quad \text{Rank } (J) = 8.$$

$$\text{Rank (conservation law)} = 9.$$

Compute the density of selected **rank**, say, 6.

- Step 2: Construct the candidate density

For example, construct a density of rank 6.

Make a list of all terms with rank 6:

$$\{u^3, u_x^2, uu_{xx}, u_y^2, uu_{yy}, u_xu_y, uu_{xy}, u_{4x}, u_{3xy}, u_{2x2y}, u_{x3y}, u_{4y}\}$$

Remove divergences and divergence-equivalent terms.

Candidate density of rank 6:

$$\rho = c_1 u^3 + c_2 u_x^2 + c_3 u_y^2 + c_4 u_x u_y$$

- Step 3: Compute the undetermined coefficients

Compute

$$\begin{aligned}
 D_t \rho &= \frac{\partial \rho}{\partial t} + \rho'(u)[u_t] \\
 &= \frac{\partial \rho}{\partial t} + \sum_{k=0}^{M_x} \sum_{\ell=0}^{M_y} \frac{\partial \rho}{\partial u_{kx\ell y}} D_x^k D_y^\ell u_t \\
 &= \left(3c_1 u^2 I + 2c_2 u_x D_x + 2c_3 u_y D_y + c_4 (u_y D_x + u_x D_y) \right) u_t
 \end{aligned}$$

Substitute $u_t = -(\alpha u u_x + \beta(u_{xx} + u_{yy})_x)$.

$$\begin{aligned}
E = -D_t \rho &= 3c_1 u^2 (\alpha u u_x + \beta (u_{xx} + u_{xy})_x) \\
&+ 2c_2 u_x (\alpha u u_x + \beta (u_{xx} + u_{yy})_x)_x + 2c_3 u_y (\alpha u u_x \\
&+ \beta (u_{xx} + u_{yy})_x)_y + c_4 (u_y (\alpha u u_x + \beta (u_{xx} + u_{yy})_x)_x \\
&+ u_x (\alpha u u_x + \beta (u_{xx} + u_{yy})_x)_y)
\end{aligned}$$

Apply the Euler operator (variational derivative)

$$\begin{aligned}
\mathcal{L}_{u(x,y)} E &= \sum_{k=0}^{M_x} \sum_{\ell=0}^{M_y} (-D_x)^k (-D_y)^\ell \frac{\partial E}{\partial u_{kx \ell y}} \\
&= -2 \left((3c_1 \beta + c_3 \alpha) u_x u_{yy} + 2(3c_1 \beta + c_3 \alpha) u_y u_{xy} \right. \\
&\quad \left. + 2c_4 \alpha u_x u_{xy} + c_4 \alpha u_y u_{xx} + 3(3c_1 \beta + c_2 \alpha) u_x u_{xx} \right) \\
&\equiv 0
\end{aligned}$$

Solve a parameterized linear system for the c_i :

$$3c_1\beta + c_3\alpha = 0, \quad c_4\alpha = 0, \quad 3c_1\beta + c_2\alpha = 0$$

Solution:

$$c_1 = 1, \quad c_2 = -\frac{3\beta}{\alpha}, \quad c_3 = -\frac{3\beta}{\alpha}, \quad c_4 = 0$$

Substitute the solution into the candidate density

$$\rho = c_1 u^3 + c_2 u_x^2 + c_3 u_y^2 + c_4 u_x u_y$$

Final density of rank 6:

$$\boxed{\rho = u^3 - \frac{3\beta}{\alpha}(u_x^2 + u_y^2)}$$

- Step 4: Compute the flux

Use the homotopy operator to invert Div:

$$\mathbf{J} = \text{Div}^{-1} E = \left(\mathcal{H}_{u(x,y)}^{(x)} E, \mathcal{H}_{u(x,y)}^{(y)} E \right)$$

where

$$\mathcal{H}_{u(x,y)}^{(x)} E = \int_0^1 (I_u^{(x)} E)[\lambda u] \frac{d\lambda}{\lambda}$$

with

$$\mathcal{I}_u^{(x)} E = \sum_{k=1}^{M_x} \sum_{\ell=0}^{M_y} \left(\sum_{i=0}^{k-1} \sum_{j=0}^{\ell} u_{ix jy} \frac{\binom{i+j}{i} \binom{k+\ell-i-j-1}{k-i-1}}{\binom{k+\ell}{k}} \right)$$

$$(-D_x)^{k-i-1} (-D_y)^{\ell-j} \right) \frac{\partial E}{\partial u_{kx \ell y}}$$

Similar formulas for $\mathcal{H}_{u(x,y)}^{(y)} E$ and $\mathcal{I}_u^{(y)} E$.

Let $A = \alpha uu_x + \beta(u_{xxx} + u_{xyy})$ so that

$$E = 3u^2A - \frac{6\beta}{\alpha}u_xA_x - \frac{6\beta}{\alpha}u_yA_y$$

Then,

$$\begin{aligned} \mathbf{J} &= \left(\mathcal{H}_{u(x,y)}^{(x)} E, \mathcal{H}_{u(x,y)}^{(y)} E \right) \\ &= \left(\frac{3\alpha}{4}u^4 + \beta u^2(3u_{xx} + 2u_{yy}) - 2\beta u(3u_x^2 + u_y^2) \right. \\ &\quad + \frac{3\beta^2}{4\alpha}u(u_{2x2y} + u_{4y}) - \frac{\beta^2}{\alpha}u_x\left(\frac{7}{2}u_{xyy} + 6u_{xxx}\right) \\ &\quad - \frac{\beta^2}{\alpha}u_y\left(4u_{xxy} + \frac{3}{2}u_{yyy}\right) + \frac{\beta^2}{\alpha}(3u_{xx}^2 + \frac{5}{2}u_{xy}^2 + \frac{3}{4}u_{yy}^2) \\ &\quad + \frac{5\beta^2}{4\alpha}u_{xx}u_{yy}, \quad \beta u^2u_{xy} - 4\beta uu_xu_y \\ &\quad - \frac{3\beta^2}{4\alpha}u(u_{x3y} + u_{3xy}) - \frac{\beta^2}{4\alpha}u_x(13u_{xxy} + 3u_{yyy}) \\ &\quad \left. - \frac{5\beta^2}{4\alpha}u_y(u_{xxx} + 3u_{xyy}) + \frac{9\beta^2}{4\alpha}u_{xy}(u_{xx} + u_{yy}) \right) \end{aligned}$$

However, $\text{Div}^{-1}E$ is not unique.

Indeed, $\mathbf{J} = \tilde{\mathbf{J}} + \mathbf{K}$, where $\mathbf{K} = (D_y\theta, -D_x\theta)$ is a curl term.

For example,

$$\theta = 2\beta u^2 u_y + \frac{\beta^2}{4\alpha} \left(3u(u_{xxy} + u_{yyy}) + 10u_x u_{xy} + 5u_y(3u_{yy} + u_{xx}) \right)$$

Shorter flux:

$$\begin{aligned} \tilde{\mathbf{J}} &= \mathbf{J} - \mathbf{K} \\ &= \left(3u^2 \left(\frac{\alpha}{4} u^2 + \beta u_{xx} \right) - 6\beta u(u_x^2 + u_y^2) + \frac{3\beta^2}{\alpha} \left(u_{xx}^2 - u_{yy}^2 \right) \right. \\ &\quad \left. - \frac{6\beta^2}{\alpha} (u_x(u_{xxx} + u_{xyy}) + u_y(u_{xxy} + u_{yyy})) \right), \\ &\quad 3\beta u^2 u_{xy} + \frac{6\beta^2}{\alpha} u_{xy}(u_{xx} + u_{yy}) \end{aligned}$$

Software Demonstration

Software packages in Mathematica

Conclusions and Future Work

- The power of Euler and homotopy operators:
 - ▶ Testing exactness
 - ▶ Integration by parts: D_x^{-1} and Div^{-1}
- Integration of non-exact expressions

Example: $f = u_x v + u v_x + u^2 u_{xx}$

$$\int f dx = uv + \int u^2 u_{xx} dx$$

- Use other homotopy formulas (moving terms amongst the components of the flux; prevent curl terms)

- Broader class of PDEs (beyond evolution type)
Example: short pulse equation (nonlinear optics)

$$u_{xt} = u + (u^3)_{xx} = u + 6uu_x^2 + 3u^2u_{xx}$$

with non-polynomial conservation law

$$D_t \left(\sqrt{1 + 6u_x^2} \right) - D_x \left(3u^2 \sqrt{1 + 6u_x^2} \right) = 0$$

- Continue the implementation in *Mathematica*
- Software: <http://inside.mines.edu/~whereman>

Additional examples on next slides

Additional Examples

- Manakov-Santini system

$$u_{tx} + u_{yy} + (uu_x)_x + v_x u_{xy} - u_{xx} v_y = 0$$

$$v_{tx} + v_{yy} + uv_{xx} + v_x v_{xy} - v_y v_{xx} = 0$$

- Conservation laws for Manakov-Santini system:

$$\begin{aligned} & D_t \left(f u_x v_x \right) + D_x \left(f (u u_x v_x - u_x v_x v_y - u_y v_y) \right. \\ & \quad \left. - f' y (u_t + u u_x - u_x v_y) \right) + D_y \left(f (u_x v_y + u_y v_x + u_x v_x^2) \right. \\ & \quad \left. + f' (u - y u_y - y u_x v_x) \right) = 0 \end{aligned}$$

where $f = f(t)$ is arbitrary.

Conservation laws – continued:

$$\begin{aligned} & D_t \left(f(2u + v_x^2 - yu_x v_x) \right) + D_x \left(f(u^2 + uv_x^2 + u_y v \right. \\ & \quad \left. - v_y^2 - v_x^2 v_y - y(uu_x v_x - u_x v_x v_y - u_y v_y)) \right. \\ & \quad \left. - f'y(v_t + uv_x - v_x v_y) + (f' - 2fx)y^2(u_t + uu_x - u_x v_y) \right) \\ & + D_y \left(f(v_x^3 + 2v_x v_y - u_x v - y(u_x v_x^2 + u_x v_y + u_y v_x)) \right. \\ & \quad \left. + f'(v - y(2u + v_y + v_x^2)) + (f'y^2 - 2fx)(u_x v_x + u_y) \right) = 0 \end{aligned}$$

where $f = f(t)$ is arbitrary.

There are three additional conservation laws.

- (2+1)-dimensional Camassa-Holm equation

$$(\alpha u_t + \kappa u_x - u_{txx} + 3\beta uu_x - 2u_x u_{xx} - uu_{xxx})_x + u_{yy} = 0$$

Interchange t with y

$$(\alpha u_y + \kappa u_x - u_{xxy} + 3\beta uu_x - 2u_x u_{xx} - uu_{xxx})_x + u_{tt} = 0$$

Set $v = u_t$ to get

$$u_t = v$$

$$\begin{aligned} v_t = & -\alpha u_{xy} - \kappa u_{xx} + u_{3xy} - 3\beta u_x^2 - 3\beta uu_{xx} + 2u_{xx}^2 \\ & + 3u_x u_{xxx} + uu_{4x} \end{aligned}$$

- Conservation laws for the Camassa-Holm equation

$$\begin{aligned} & D_t(fu) + D_x \left(\frac{1}{\alpha} f \left(\frac{3\beta}{2} u^2 + \kappa u - \frac{1}{2} u_x^2 - uu_{xx} - u_{tx} \right) \right. \\ & \left. + \left(\frac{1}{2} f' y^2 - \frac{1}{\alpha} fx \right) (\alpha u_t + \kappa u_x + 3\beta uu_x - 2u_x u_{xx} - uu_{xxx} \right. \\ & \left. - u_{txx}) \right) + D_y \left(\left(\frac{1}{2} f' y^2 - \frac{1}{\alpha} fx \right) u_y - f' y u \right) = 0 \end{aligned}$$

$$\begin{aligned} & D_t(fyu) + D_x \left(\frac{1}{\alpha} fy \left(\frac{3\beta}{2} u^2 + \kappa u - \frac{1}{2} u_x^2 - uu_{xx} - u_{tx} \right) \right. \\ & \left. + y \left(\frac{1}{6} f' y^2 - \frac{1}{\alpha} fx \right) (\alpha u_t + \kappa u_x + 3\beta uu_x - 2u_x u_{xx} - uu_{xxx} \right. \\ & \left. - u_{txx}) \right) + D_y \left(y \left(\frac{1}{6} f' y^2 - \frac{1}{\alpha} fx \right) u_y + \left(\frac{1}{\alpha} fx - \frac{1}{2} f' y^2 \right) u \right) = 0 \end{aligned}$$

where $f = f(t)$ is an arbitrary function.

- Khoklov-Zabolotskaya equation
describes e.g., sound waves in nonlinear media

$$(u_t - uu_x)_x - u_{yy} - u_{zz} = 0$$

Conservation law:

$$\begin{aligned} & D_t(fu) - D_x\left(\frac{1}{2}fu^2 + (fx+g)(u_t - uu_x)\right) \\ & + D_y\left((fx+g)u_y - (f_yx+g_y)u\right) \\ & + D_z\left((fx+g)u_z - (f_zx+g_z)u\right) = 0 \end{aligned}$$

under the constraints $\Delta f = 0$ and $\Delta g = f_t$
where $f = f(t, y, z)$ and $g = g(t, y, z)$.

- Shallow water wave model (atmosphere)

$$\mathbf{u}_t + (\mathbf{u} \cdot \nabla) \mathbf{u} + 2\boldsymbol{\Omega} \times \mathbf{u} + \nabla(\theta h) - \frac{1}{2}h\nabla\theta = \mathbf{0}$$

$$\theta_t + \mathbf{u} \cdot (\nabla \theta) = 0$$

$$h_t + \nabla \cdot (\mathbf{u} h) = 0$$

where $\mathbf{u}(x, y, t), \theta(x, y, t)$ and $h(x, y, t)$.

- In components:

$$u_t + uu_x + vu_y - 2\Omega v + \frac{1}{2}h\theta_x + \theta h_x = 0$$

$$v_t + uv_x + vv_y + 2\Omega u + \frac{1}{2}h\theta_y + \theta h_y = 0$$

$$\theta_t + u\theta_x + v\theta_y = 0$$

$$h_t + hu_x + uh_x + hv_y + vh_y = 0$$

- First few conservation laws of SWW model:

$$\rho_{(1)} = h$$

$$\rho_{(2)} = h \theta$$

$$\rho_{(3)} = h \theta^2$$

$$\rho_{(4)} = h (u^2 + v^2 + h\theta)$$

$$\rho_{(5)} = \theta (2\Omega + v_x - u_y)$$

$$\mathbf{J}^{(5)} = \frac{1}{2} \theta \begin{pmatrix} 4\Omega u - 2uu_y + 2uv_x - h\theta_y \\ 4\Omega v + 2vv_x - 2vu_y + h\theta_x \end{pmatrix}$$

$$\mathbf{J}^{(1)} = h \begin{pmatrix} u \\ v \end{pmatrix}$$

$$\mathbf{J}^{(2)} = h \theta \begin{pmatrix} u \\ v \end{pmatrix}$$

$$\mathbf{J}^{(3)} = h \theta^2 \begin{pmatrix} u \\ v \end{pmatrix}$$

$$\mathbf{J}^{(4)} = h \begin{pmatrix} u (u^2 + v^2 + 2h\theta) \\ v (v^2 + u^2 + 2h\theta) \end{pmatrix}$$

- More general conservation laws for SWW model:

$$D_t(f(\theta)h) + D_x(f(\theta)hu) + D_y(f(\theta)hv) = 0$$

$$\begin{aligned} & D_t(g(\theta)(2\Omega + v_x - u_x)) \\ & + D_x\left(\frac{1}{2}g(\theta)(4\Omega u - 2uu_y + 2uv_x - h\theta_y)\right) \\ & + D_y\left(\frac{1}{2}g(\theta)(4\Omega v - 2u_yv + 2vv_x + h\theta_x)\right) = 0 \end{aligned}$$

for any functions $f(\theta)$ and $g(\theta)$.

- Kadomtsev-Petviashvili (KP) equation

$$(u_t + \alpha uu_x + u_{xxx})_x + \sigma^2 u_{yy} = 0$$

parameter $\alpha \in \mathbb{R}$ and $\sigma^2 = \pm 1$.

Equation be written as a conservation law

$$D_t(u_x) + D_x(\alpha uu_x + u_{xxx}) + D_y(\sigma^2 u_y) = 0.$$

Exchange y and t and set $u_t = v$

$$u_t = v$$

$$v_t = -\frac{1}{\sigma^2}(u_{xy} + \alpha u_x^2 + \alpha uu_{xx} + u_{xxxx})$$

- Examples of conservation laws for KP equation
(explicitly dependent on t , x , and y)

$$D_t(xu_x) + D_x(3u^2 - u_{xx} - 6xuu_x + xu_{xxx}) + D_y(\alpha x u_y) = 0$$

$$D_t(yu_x) + D_x(y(\alpha uu_x + u_{xxx})) + D_y(\sigma^2(yu_y - u)) = 0$$

$$D_t(\sqrt{t}u) + D_x\left(\frac{\alpha}{2}\sqrt{t}u^2 + \sqrt{t}u_{xx} + \frac{\sigma^2 y^2}{4\sqrt{t}}u_t + \frac{\sigma^2 y^2}{4\sqrt{t}}u_{xxx}\right)$$

$$+ \frac{\alpha\sigma^2 y^2}{4\sqrt{t}}uu_x - x\sqrt{t}u_t - \alpha x\sqrt{t}uu_x - x\sqrt{t}u_{xxx}\right)$$

$$+ D_y\left(x\sqrt{t}u_y + \frac{y^2 u_y}{4\sqrt{t}} - \frac{yu}{2\sqrt{t}}\right) = 0$$

- More general conservation laws for KP equation:

$$\begin{aligned} & D_t \left(f u \right) + D_x \left(f \left(\frac{\alpha}{2} u^2 + u_{xx} \right) \right. \\ & \quad \left. + \left(\frac{\sigma^2}{2} f' y^2 - f x \right) (u_t + \alpha u u_x + u_{3x}) \right) \\ & + D_y \left(\left(\frac{1}{2} f' y^2 - \sigma^2 f x \right) u_y - f' y u \right) = 0 \end{aligned}$$

$$\begin{aligned} & D_t \left(f y u \right) + D_x \left(f y \left(\frac{\alpha}{2} u^2 + u_{xx} \right) \right. \\ & \quad \left. + y \left(\frac{\sigma^2}{6} f' y^2 - f x \right) (u_t + \alpha u u_x + u_{3x}) \right) \\ & + D_y \left(y \left(\frac{1}{6} f' y^2 - \sigma^2 f x \right) u_y + (\sigma^2 f x - \frac{1}{2} f' y^2) u \right) = 0 \end{aligned}$$

where $f(t)$ is arbitrary function.

- Potential KP equation

Replace u by u_x and integrate with respect to x .

$$u_{xt} + \alpha u_x u_{xx} + u_{xxxx} + \sigma^2 u_{yy} = 0$$

- Examples of conservation laws
(not explicitly dependent on x, y, t):

$$D_t(u_x) + D_x\left(\frac{\alpha}{2}u_x^2 + u_{xxx}\right) + D_y(\sigma^2 u_y) = 0$$

$$D_t(u_x^2) + D_x\left(\frac{2\alpha}{3}u_x^3 - u_{xx}^2 + 2u_x u_{xxx} - \sigma^2 u_{yy}\right)$$

$$+ D_y(2\sigma^2 u_x u_y) = 0$$

Conservation laws for pKP equation – continued:

$$\begin{aligned} & D_t(u_x u_y) + D_x \left(\alpha u_x^2 u_y + u_t u_y + 2u_{xxx} u_y - 2u_{xx} u_{xy} \right) \\ & + D_y \left(\sigma^2 u_y^2 - \frac{1}{3} u_x^3 - u_t u_x + u_{xx}^2 \right) = 0 \end{aligned}$$

$$\begin{aligned} & D_t \left(2\alpha u u_x u_{xx} + 3u u_{4x} - 3\sigma^2 u_y^2 \right) + D_x \left(2\alpha u_t u_x^2 + 3u_t^2 \right. \\ & \left. - 2\alpha u u_x u_{tx} - 3u_{tx} u_{xx} + 3u_t u_{xxx} + 3u_x u_{txx} - 3u u_{txx} \right) \\ & + D_y \left(6\sigma^2 u_t u_y \right) = 0 \end{aligned}$$

Various generalizations exist.

- Generalized Zakharov-Kuznetsov equation

$$u_t + \alpha u^n u_x + \beta(u_{xx} + u_{yy})_x = 0$$

where n is rational, $n \neq 0$.

Conservation laws:

$$D_t(u) + D_x\left(\frac{\alpha}{n+1}u^{n+1} + \beta u_{xx}\right) + D_y(\beta u_{xy}) = 0$$

$$\begin{aligned} & D_t(u^2) + D_x\left(\frac{2\alpha}{n+2}u^{n+2} - \beta(u_x^2 - u_y^2) + 2\beta u(u_{xx} + u_{yy})\right) \\ & + D_y(-2\beta u_x u_y) = 0 \end{aligned}$$

- Third conservation law for gZK equation:

$$\begin{aligned}
& D_t \left(u^{n+2} - \frac{(n+1)(n+2)\beta}{2\alpha} (u_x^2 + u_y^2) \right) \\
& + D_x \left(\frac{(n+2)\alpha}{2(n+1)} u^{2(n+1)} + (n+2)\beta u^{n+1} u_{xx} \right. \\
& - (n+1)(n+2)\beta u^n (u_x^2 + u_y^2) + \frac{(n+1)(n+2)\beta^2}{2\alpha} (u_{xx}^2 - u_{yy}^2) \\
& \left. - \frac{(n+1)(n+2)\beta^2}{\alpha} (u_x(u_{xxx} + u_{xyy}) + u_y(u_{xxy} + u_{yyy})) \right) \\
& + D_y \left((n+2)\beta u^{n+1} u_{xy} + \frac{(n+1)(n+2)\beta^2}{\alpha} u_{xy} (u_{xx} + u_{yy}) \right) = 0.
\end{aligned}$$
